

Creating a Multiple Page Website:

Follow the steps below to get started.

So far you have created 2 single web pages. Now we will create a multiple page website together. The process for creating a multi page site is much like the process for creating a single page site. We will create a series of 5 single pages and link them together. The first page will be the main page or home page, the pages that follow will be the sub-pages. Don't work too fast, don't work too far ahead. Follow directions and don't get confused, you've done all of this before.

1. Go to your folder in Student Work.
2. Create a new folder and name it "Web Site"
3. Open notepad.
4. Each of the documents should contain the following code, you may copy and paste it:

```
<html>
<head>
<title>

</title>
</head>
<body
 bgcolor="#FFFFFF"
 text="#000000"
 link="#0000FF"
 vlink="#880088"
 alink="#FF0000">
```

5. You may also want to add the first font tag to the page. In this way, you can guarantee that all of the other pages will be formatted EXACTLY the same way. You can also use this prep time to choose colors using the color picker website and kuler.adobe.com.
6. Save the document in the folder you have created.
7. Name the document as follows:
Last, First Date Index.html
8. Repeat step 7 four more times numbering pages 1-4. We will rename these pages later. These pages will become the pages of your website. All you will need to do is gather links and images and arrange them on the page.
